How to build smart contracts with Marlowe

Part 1

Are smart contracts tough to code?

With Solidity, yes.
With Marlowe, no!

Marlowe is a domain-specific smart contract language designed specifically for financial applications.

Unlike Solidity, Marlowe is simple, intuitive, and easy for non-technical users.

Examples of what you can create using Marlowe:

1. Asset-backed securities
2. Betting contracts
3. Bonds
4. Crowdfunding contracts
5. Derivatives contracts
6. Escrow contracts

7. Invoicing & payment systems

8. Insurance contracts

9. Investment contracts

10. Loan contracts

11. Payment agreements

12. Real estate contracts

13. Supply chain finance

In Part 2, we will study the code of a Marlowe smart contract.
