BREAKING DOWN

# AI

---

WHAT ARE THE BASICS?

# THREE TYPES OF AI

---

## **Artificial Narrow Intelligence:**

performs tasks specific in nature and dependent on human training with datasets.

## **Artificial General Intelligence:**

simulates human intelligence performing a diverse range of functions, equal to human ability (currently only hypothetical).

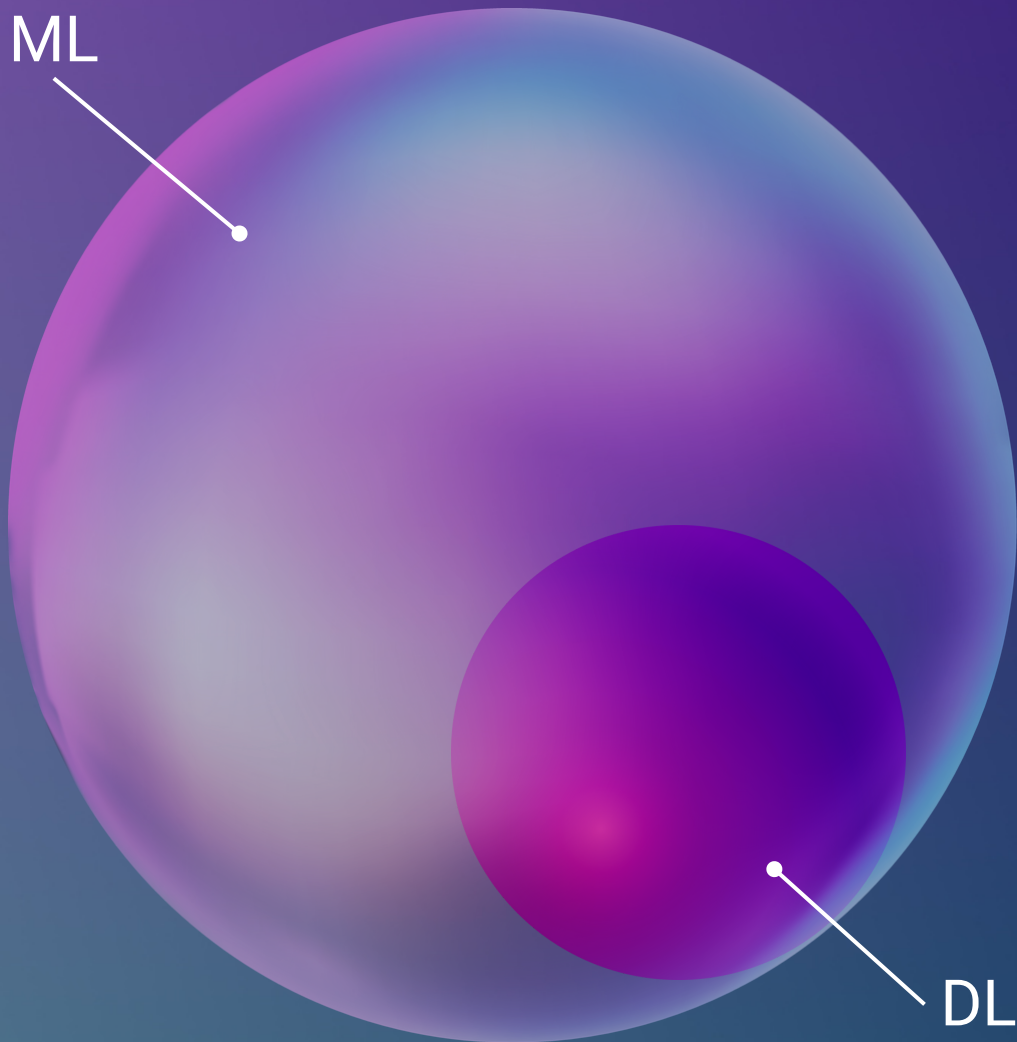

## **Artificial Super Intelligence:**

surpasses human intelligence with its own consciousness (currently only hypothetical).

# MACHINE LEARNING (ML) & DEEP LEARNING (DL)

---

**Machine Learning** algorithms learn and automatically make predictions based on experience and past data without being explicitly programmed.

**Deep Learning** is a subset of ML and does not require the initial human intervention ML does.

# NEURAL NETWORKS (NN)

Simulating the structure of a human brain, NNs are a series of nodes layered into input and output layers to recognize patterns and process data. Most used NNs or architectures are Recurrent and Convolutional Neural Networks (RNN, CNN), and newer Transformer (e.g., GPT, Bard).

# NATURAL LANGUAGE PROCESSING (NLP)

---

At the intersection of AI, computer science and linguistics, NLP is a technique to analyze and process large amounts of language data and semantics. Text-to-image, text-to-video are newer applications, as well as emulating "cognitive" processes.
